This article gathers most of the ormus information and relevant videos in one place, making it easy for you to evaluate ormus and the claims of white powder gold benefit.

It is the reader's job to verify the information. The documentation provided is your tool for doing so.

This article is work in progress. The question is: Are nanoparticles the same as ormus m-state elements?

Walter Sorochan is an independent research-writer with no vested interests.

What is ormus? NEW Ormus is a form of matter that is found as a single atom or monatomic state and is referred to as an element. Plants convert minerals in the soil into an element state; and animals and humans, in turn, can ingest ormus elements from the plant food that we eat. Ormus has special energy properties, referred to as life energy force that is found in all living things. Ormus enhances health, spirituality, extends life and is claimed to connect living things with each other and the universe. It is matter made up of small inert single atom elements referred to as "ormes" or m-state elements .... like gold, silver, lead, Ruthenium, Rhodium, Iridium, Platinum and Osmium. This new form of matter is not part of the normal elements in the traditional Periodic Table of Elements and behaves differently from the metal elements we have been taught in school. Beginner's introduction to Ormus by Barry Carter:

"Sure, imagine that there's a bunch of nutrients like vitamin C or B vitamins or calcium or magnesium, nutrients that nobody ever knew about up until now. Or let's say science didn't know about them. Maybe ancient people knew about them, but modern people don't know anything about them. And these nutrients, because of their nature –- the way they work physically, as physical substances -- they're very, very difficult to identify using modern spectroscopic analysis and so on. And these nutrients are essential nutrients. You need them in your body and in fact, they're even in the air and all water and everything that we eat, but we're doing a lot of things to them that we really don't know that we're doing to them. We're doing things like, oh, using cell phones and that destroys them; or using microwave ovens and that destroys them; or cooking on electric burners, that dries them off. All of the things that we do with these nutrients to damage them or drive them away depletes them in our

body, so we don't get as many of these nutrients. So when we start getting them, all kinds of wonderful things happen.

Now, the interesting thing about these nutrients is that they have a very unexpected source. Gold, silver, platinum and other precious metal elements have this kind of ormus form where they literally take on a different atomic form and they're no longer functional as metal. They no longer even behave like metal. In fact, if you have the ormus form of gold or silver, it looks like a white powder; or like an oil; and in this other form, they are very beneficial, whereas as metal, they may be toxic. So doing anything that would convert them from the ormus form to the metallic form probably isn't a good thing. People have actually done that. They've actually converted these from metal and then back from metal –- from metal to ormus and then back from ormus to metal –- and the processes they used were things like heating them on an electric burner to convert the metal, or putting them in a microwave oven and microwaving it to convert the metal. So, we have a pretty good idea what they are and what happens to them under certain circumstances that people are doing all the time.

Now, what we're finding is that these elements in their ormus form, are very, very beneficial to plants, animals and people. We've got studies of a quarter of a million chickens that were fed ormus that was made from sea water. Sea water specifically, and all these chickens experienced improved health, improved growth and reduced conditions like chickens when they grow too fast, often their legs will... the bones in their legs will get rubbery. It's what they call rubber legs. They literally will not support the body. Well, these chickens grew fast and didn't have rubber legs, things like that have happened and have been measured." Ormus elements are reputed to exist in soil, salt, ocean, air, plants and animals and need to be extracted by special chemical processes. An example of this is in the graphic below:

The graphic above illustrates the raw materials for ormus, the simplistic and incomplete chemistry making it and the new matter, white powder gold and some of its benefits.

A claim was been made by David Hudson in his 1995 Dallas lecture for ormus as magical and mysterious: Carter: Monatomic or what

> "For those of you who are interested, did you know that NASA has learned that you can scrape tissue out of the cheeks of the astronauts, and put the equivalent of a lie detector instrument on the tissue and that when the astronaut is out there, you know, millions of light years away, that when he's subjected to stress, that the cells instantaneously experience stress here on Earth even though they're not in his body." Ancient Ormus Names:

The power of ancient gold has been referred to by many different names, such as The Philosopher's Stone, Golden Fleece, Ark of the Covenant, the White Powder of Gold, Ma-na or Manna, Morning Dew, Food of the Gods, Elixir of Life, Star Fire, Holy Grail, white bread of the Egyptians, the golden coffer and there are more. Although these white gold powders are purported to have been created by Egyptians 6000 years ago, and the alchemy of the middle ages rekindled interest in transmutating metals into gold, we re-discovered it as "ormus" in 1979.

History about Ormus in United States

In the 80's and 90's David Hudson, an Arizona cotton farmer turned scientist, coined the word **ORMEs** when he discovered he had difficulty recovering gold and silver from mine wastes. The recovered substances did not behave as they were supposed to by mining processes. After much gold refinement and testing, he discovered a substance that he named as white powder gold. He defined the new state of matter ormes.

ORMEs is an acronym for "**Orbitally Rearranged Monatomic Elements** [also referred to as monatomic elements or m-state elements]. Hudson demonstrated, through his very detailed experiments and multiple testing, that at least 13 of the **transition elements** in the Periodic Table of Elements, [Co, Ni, Cu, Ru, Rh, Pd, Ag, Os, Ir, Pt, Au, Hg], can exist in a heretofore-unidentified state of matter. Ormes are atoms which comprise a substance in which its atoms are not bound to each other [called a single atom or monatomic state]. They constitute a newly discovered form (phase) of matter [referred to as "exotic matter"] with entirely different physical properties from normal elements as found in the Periodic table.

Symbol	Transition elements:
Ag	Silver
Au	Gold
Co	Copper
Hg	Mercury
Ir	Iridium
Os	Osmium
Pb	Lead
Pd	Palladium
Pt	Platinum
Rh	Rhodium
Ru	Ruthenium

Hudson found that elements in a monatomic state are very chemically inert. In conventional chemistry it is believed that all chemical reactions between elements take place [combine] because of the action of their outer + and - electrons. Now, what David Hudson deduced, was that when these transition elements exist in a monatomic state and are not sharing or swapping their electrons with their near neighbors in a material structure like a crystal lattice [e.g $Na^{+}Cl^{-}$], they become ORMEs elements. At this stage the outer electrons of these elements form cooper pairs [negative -electrons seeking each other out] and become whirlwinds of light rotating at super speeds around the atom. Again, as a result of this change they lose all conventional chemical reactivity. Another important change taking place is that the whirling electrons have become light and set up a Meissner antimagnetic field. This antimagnetic field causes a levitating force against the earth magnetic field and the element effectively loses 4/9's of its weight. Hudson: monatomic ormie Back to top

Difference between Monatomic and Diatomic properties: or white gold vs metallic gold

The only difference between the two is the manner in which groups of atoms are bonded together. A monoatomic element has one atom per molecule; a diatomic element has two atoms per molecule. An interesting feature of monatomic elements is ability to switch from an inert state to a metallic state at different temperatures.

In general, a metallic element is physically stable and is a relatively good conductor of both heat and electricity and is usually chemically active. Although metals typically rust and/or corrode, monatomic atoms of the same element behave more like a ceramic in that they are generally poor conductors of both heat and electricity and are chemically inert or inactive and do not combine. In addition, according to Hudson, monatomic elements exhibit the characteristics of superconductors at room temperature. Back to top

So .... what is the evidence that ormus m-elements are real? Advanced Spectometry technology can identify both diatomic and monatomic elements. Reports from independent researchers at various international labs and organizations can also help verify ormus m-elements.

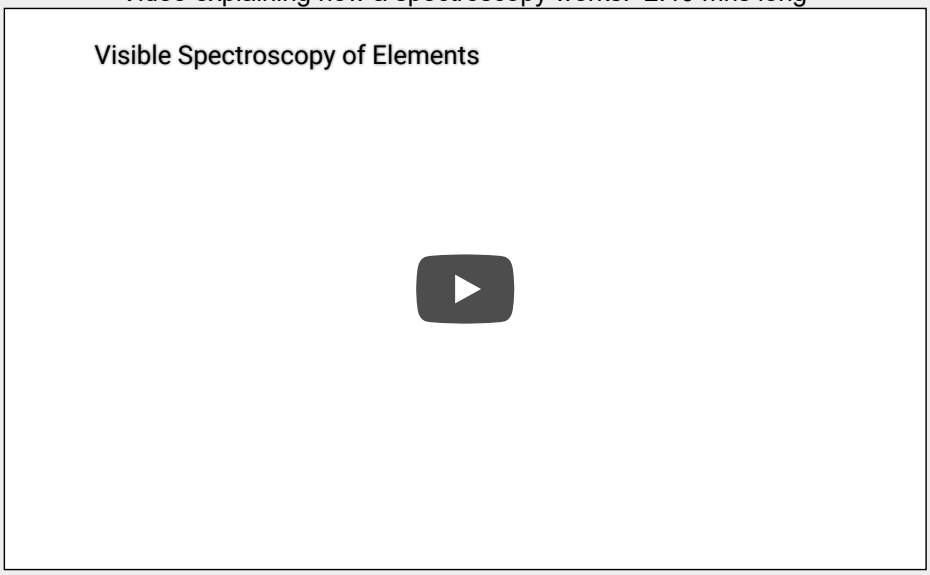
Spectroscopy technique to identify monatomic elements: Hudson: monatomic ormie

None of the standard detection techniques of analytical chemistry can detect monatomic elements. They can only detect metallic elements by interacting with their valence electrons. Because the valence electrons of monatomic atoms are unavailable, the atoms are unidentifiable. To detect a monatomic element requires that you first convert it from its monatomic state to its normal state to allow the element to be detected with conventional instrumentation.

ORMUS elements were not previously noticed by the scientific community because these are impossible to assay or detect with standard laboratory instruments like spectroscopy. But there is a way to verify that ormus is real. This section discusses this procedure.

Spectroscopy is the science of using spectral or colored lines to figure out what something is made of. Each element has its own unique fingerprint or signature that identifies it as being different from all other elements or matter. Distinct elements can be made to appear by changing the temperature or burning.

Video explaining how a spectroscopy works: 2:40 mns long



Analytical Chemistry has used the spectroscope to identify elements in matter. Unfortunately, the conventional spectroscope has limitations because it was designed to detect elements by interacting with their valence electrons which are in a diatomic state. Ormus m-elements exist in a single atom and cannot be identified by conventional techniques. Hudson explains in greater detail the limitations of conventional spectroscopy.

Hudson had a most difficult time using traditional spectroscopy to identify ormus. Here is the background of what happened. In a technique called “fractional vaporization”, the monoatomic elements can be found and clearly identified via a more advanced emission spectroscopy. This fact was first discussed by David Radius Hudson, who was attempting to separate gold and silver from raw ore -- but was hindered by the ghost gold which had no apparent intrinsic value.

The process involved placing a sample on a standard carbon electrode, running a second carbon electrode down to a position just above the first, and then striking a Direct Current arc across the electrodes. The electrical intensity of the arc would ionize the elements in the sample such that each of the elements would give off specific, identifying frequencies of light. By measuring the specific frequencies of light (the spectrum of the element or elements), one could then identify which elements were in the sample. Typically, such spectroscopic analysis involves striking the arc for 10 to 15 seconds, at the end of which, the carbon electrodes are effectively burned away. According to the majority of American spectroscopists, any sample can be ionized and read within those 15 seconds.

In the advanced technique, the carbon electrodes are sheathed with an inert gas (such as Argon). This allows the emission spectroscopy process to be continued far beyond the typical 15 seconds, in order to fully identify all of the elements in their various forms.

When this was done, in the first seconds, the ghost gold might be identified as iron, silicon, and aluminum. But as the burn process continued for as long as 300 seconds, palladium began to be read at about 90 seconds, platinum at 110 seconds, ruthenium at 130 seconds, rhodium at 145 seconds, iridium at 190 seconds, and osmium at 220 seconds. These latter readings were the monatomic elements. Commercially available grades of these metals were found to be including only about 15% of the emission spectroscopic readings.

The mining activity of what is considered the best deposit in the world for six of these elements (Pd, Pt, Os, Ru, Ir, and Rh) yields one-third of one ounce of all these precious metals per ton of ore. But this is based on the standard spectroscopic analysis. When the burn is continued for up to 300 seconds, the same ores might easily yield emission lines suggesting: 6 to 8 ounces of palladium, 12 to 13 ounces of platinum, 150 ounces of osmium, 250 ounces of ruthenium, 600 ounces of iridium, and 1200 ounces of rhodium! Hudson: monatomic ormie Back to top

Additional Proof that ormus elements do exist:

"Independent researchers have re-discovered a new, previously hidden, form of matter that may provide tremendous advancements to human nutrition. Since 1986, the top physicists in the world, at the Niels Bohr Institute and at Argonne National Laboratory, at Brookhaven …. have found that there are a group of elements in the center of the Periodic Table of Elements that go through this strange state of existence." Hudson: monatomic ormie

Physicists have recently created a new state of matter which appears to be related to ORMUS in the laboratory. This state of matter is called a Bose-Einstein Condensate (BEC) after Satyendra Nath Bose and Albert Einstein who postulated the existence of this state of matter in the 1920s. Their theory was not "proven" until BECs were created in the laboratory in 1995 by Eric Cornell and Carl Wieman in Boulder, Colorado. They did it by cooling atoms to a much lower temperature than had been previously achieved. This temperature was a millionth of a degree above absolute zero.

Precious metals, including copper, silver, gold, rhodium, iridium and platinum (and others) exist in a modified state, where they no longer display the electric, spectroscopic, chemical, or thermal properties usually associated with the "metal" state. The resulting new material appears crystalline, stable, non-conductive, heat resistant, and chemically inert. These inert elements are both natural and ubiquitous, they permeate the environment, our food, and our bodies. Carter, a leading authority on ormus, hypothesizes that ormus matter super conducts our thoughts, as well as the thoughts of every living cell. Carter suspects that ORMUS helps cells to get more of what they need and, also, to get rid of what they don't need. Perhaps it does this by helping to change the structure of water so that the water is "wetter". This "wetter" water might carry more nutrients into the cells and carry more toxins out." Carter: what is ormus 2012

Since 1979, the interest in the white powder gold properties has evolved keen interest among scientists. NASA and others have, since 2000, been applying these properties to theoretical space travel, as well as teleportation and even Tesla's free air energy. However, scientists are barely scratching the surface of all these possibilities. Quite a few scientists right now believe that something called **quantum coherence** exists in biological systems; people and plants and animals. Quantum coherence means that there's an instantaneous communication system going on between living things.

The center of the periodic table of elements [illustration on the right] consists of what are known as the **"transition elements,"** [encircled in black] meaning that they can transit or move from metallic diatomic state to monatomic state by chemical treatment or through other means [what some would refer to as "shadow chemistry" or "arcane chemistry" or even "alchemy"]. Take gold for example. When you have two or more gold atoms in a microcluster [A microcluster is a small chemically inert cluster of atoms that has definite crystalline structure. Microclusters can be as large as 200 or more atoms.], it will have metallic properties, but if you have only one atom, it will then have ceramic properties, which means that it becomes chemically inert but at the same time will have superconductive capabilities even at room temperature.

At the micro-nano level, there is a biological and harmonic connection between our biological pulsating frequency or resonance [an Extremely Low Frequency (ELF) wave] that exists naturally in the space and on earth. All living things on earth, including humans, have a vibrating frequency [call it low level electricity], that is tuned to this mother earth wave. The low frequency allows cells to absorb energy more readily and to communicate with other cells and, in turn, communicate with other persons.

"This weak earth resonance vibrates at a pulse of 7.83 Hertz (cycles) which is also the same as the 7.83 Hertz of brainwave frequency often detected when psychics are in their intuiting mode." **Fiorenza: Planetary Harmonics** Ormus m-elements likewise have frequency vibrations that would facilitate connections between humans.

Related to ormus is research that helps us understand how ormus may help us to function. Scientists Grazyna Fosar and Franz Bludorf from Germany in 2001 proved that our body is programmable by language, words and thought. Our DNA can feed its proper data into the network of other cells. The DNA attracts these bits of information from even outside our body and passes them on to our consciousness.

Plant benefit Claims made for ormus:

Carter shows photographic evidence that ormus is incredibly beneficial for plants; pictures of two sets of walnuts –- one that was grown on a tree that was given ormus and the other set that was grown on a tree that wasn't given ormus. [photos on right] Trees that were planted in the same place at the same time, from the same seed stock and after about four years of growth, the ormus tree [the tree that was given the ormus] had walnuts on it that were four and a half times the size of the tree that didn't have it. Health benefits claimed for ormus:

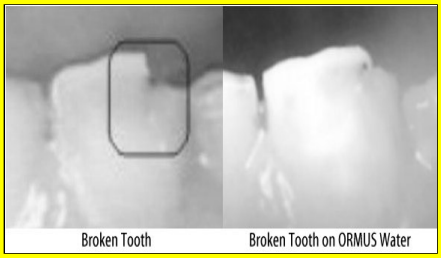
Medical researchers heard about rhodium curing cancer from ormus investigators. So impressed have they been with these claims that eight cancer laboratories are trying to secretly replicate these results. Carter reports that Researchers at National Institute of Health [N.I.H.] and Merck are now working with Orbitally Rearranged Monoatomic Elements - specifically rhodium. The researchers at these facilities of course may not understand what these materials are, where they came from, or how to analyze for them. Carter: health benefits of ormus

Carter also reported beneficial results when a mixture of m-rhodium (70%) m-iridium (15%) and m-gold (15%) is taken as treatment for the following diseases: AIDS, Alzheimer's disease, Bipolar disorder, Cancer - lymphatic cancer, breast cancer, bone cancer, leukemia, brain tumors, prostate cancer, lung cancer, ovarian cancer, thyroid cancer and uterine cancer; Diabetes, Emphysema, Heart disease, Hepatitis C, Kidney problems, Liver disease, Lou Gehrig's disease, Lupus, Muscular dystrophy, Multiple sclerosis, and Osteoporosis. Carter: health benefits of ormus When m-state elements rhodium, iridium and gold are in a mixture they work as co-factors in supporting roles.



Carter extols health benefits he has experienced using ormus, including improved dental health [teeth self-repair on left], hair color returns, less arthritis pain, improved spirituality and bolstered immunity. Jittapiromsak: Acemannan restores teeth 2010

Ormus M-elements are embedded into the DNA structure of plants and animals and are thought to be an integral part of our skin, nails, hair, blood, brain, and all the organs of our body.

The body, the cells within the body, and the DNA within the cells in the body, are all resonators working like a two-way radio. Each cell gives off very small amplitude vibrating frequencies that can communicate with all other

cells in the body.

This is neurological transmission similar to that discovered in 1998 by Dr. Glen Rei at Quantum Biology Research Labs. Natural atomic and molecular resonance vibrations in the body emit electro magnetic and acoustic energy fields which regulate biochemical processes—health or disease.

Inter-cellular communication among cells is quickly increased when Ormus enters the human body. When each of the cells is 'enlivened' and is communicating with its environs and the rest of the body, balance and health is more easily and quickly restored. The cells are recharged and rejuvenated.

Ormus has enormous potential benefits for the central nervous system by way of "cellular resonance". Carter visualizes m-state elements being able to send resonance waves [similar to radio stations] to cells and the cells, in turn, being able to communicate between cells, including the DNA. Carter: Ormus & DNA repair Such communication is made possible by cells having water that has liquid crystals. A liquid crystal is technically defined as having form, liquid properties, stored information and a measurable electromagnetic field. Liquid crystals in water in cells communicate energy and information from cell to cell [cellular coherence].

Body liquid crystals in cells help explain how meditative, yoga practices, vibrational-resonance tuning and acupuncture are so beneficial to psychological and physical health. Carter: health benefits of ormus

Since water is a major component in the human body and water has crystalline matrix, this adds credibility to the view that ormus m-elements in water solution can have an affect on healing and how the body functions. Cells can communicate between each other, the brain and body organs within a person. Such within the body communication also makes it possible for person to person telepathic communication. What you think does

affect each cell! [research placebo effect] Back to top

But a word of caution: even Carter and other proponents of the benefits of supplements emphasize that such usage is not approved by the FDA and other scientific bodies at this time.

Metallic elements like mercury and lead, are toxic to humans. Metallic gold is the exception and is non-toxic. This is why the Food and Drug Administration [USFDA] has approved it to be used as a supplement. The USFDA considers gold as a safe food additive and skin care supplement.

Ormes m-elements are thought to produce incredible physical and mental health benefits. This new perception of the magic power of ormus gold is not a new discovery! According to historians, the Sumerians and Egyptians believed that monatomic gold encouraged spiritual transformation and promoted optimal health, because of its health enhancing effects on the body, brain and pineal gland. Monatomic gold is believed to have been eaten by the ancient Egyptians and was depicted to be a food of the gods which would assist the Egyptians in unlocking their innate mental and spiritual abilities.

Where is ormus matter found?

ORMEs are naturally occurring in certain volcanic soils dating back to a geological event which occurred about 60 million years ago. ORMUS state elements are likely produced by thermal-chemical reactions within the Earth's core and brought to surface during volcanic eruptions. They can be found virtually anywhere on the Earth's surface, and in concentrated amounts in volcanic soils. Plants grown on volcanic soils tend to display higher amounts of ormus matter than those grown on other soils. Carter: what is ormus 2012

Scientist/farmer David Hudson found Ormus in the air, soil, plants, stones, and the sea. Such soils are present throughout the world and western United States. Soils which are considered rich in these elements might contain up to six percent of ormus material. The remaining 94 percent or more of the material is ordinary dirt comprised mainly of silicon compounds.

Ormus-Rich Plants & Edibles:

Plant sources Hamilton: Ormus products 2010

The bestway to get the nutrients you need is to eat health promoting foods. This is much better option than taking supplements. The reason that this is so is because when you consume health promoting foods [i.e. nutrient dense, plant-based foods] for any one particular nutrient you are also getting many other added benefits; such as increased fiber intake, consuming many other helper [cofactor] important vitamins, minerals, antioxidants, and phytochemicals contained within these foods. Many vitamin-mineral-amino acid supplements do not include nutrient helpers to help absorb the supplement and use it in the body.

Hudson in 1998 shared a list below of ormus foods; raw vegetables, fruits, nuts, salts and spring and ocean water have ormes. The concentrations vary depending upon the abundance of the elements in the soil in which these plants are

grown. It is possible that the best way to ingest these elements is in the forms of plants grown in soils rich in these non-metallic elements. Carter: what is ormus 2012

The list of plants below is not complete and is very rudimentary. The green list is based on the soil that they are grown; thus having specific amounts of rhodium and iridium. Boiling and cooking food, microwaving, or heating food changes the chemistry of raw foods; causing the ormus state of food to flip the ormus into a metallic state. [foods in metallic state do not have ormus properties] The foods listed are in a raw and uncooked state! The white list is a list of additional plants that other scientists found to contain unspecified amounts of ormes. Back to top

Making ORMUS for plants [as fertilizer] is generally best realized as precipitate from salt sea water:

- Slowly bring the pH of ocean water or Dead Sea water or raw sea salt (dissolved in water) up to 10.78 and no higher.
- use a tablespoon of lye (sodium hydroxide) dissolved in ½ cup of water.
- Let the resulting precipitate settle, siphon the clear water off the top and add fresh water to wash it.
- Purify --Repeat the second step three or four more times.

As the pH is raised to 10.78 you will notice that the pH seems to hang for a long time around pH 9.8 - 9.9. This happens because the lye cannot raise the pH as long as it is being used up in reaction with the ORMUS and magnesium in the sea water.

You can also purchase the precipitate from the ORMUS providers which are listed at: http://www.subtleenergies.com/ormus/tw/sources.htm#2

Once you have the precipitate it [as fertilizer] is very important to apply it at the appropriate rate. It is typically applied at the rate of one to three gallons per acre (ten to thirty one liters per hectare) for each crop. [This is usually just once a year for trees but will be with each planting for grasses which get multiple cuttings.] Plant application has been calculated application rates for ORMUS precipitate in agriculture and Sea-Crop, one of the ORMUS providers, also has a page on this at: http://www.sea-crop.com/application.html Back to top

Having read this far, you probably have your own views about ormus. Perhaps some readers may be thinking of getting some ormus supplement and experimenting with it. BEWARE: You are on your own.

Advise for ormus supplement users:

Prior to ingesting ormus of any kind, Carter suggests that you pre-plan to monitor the affect ormus may have on you. Make it possible to make a pre-post comparison of changes as a way of helping you to evaluate whether ormus did make changes to you. Carter outlines below how you should do this.

Barry Carter, who makes and markets ormus supplements, advises those wanting to ingest or use ormus for healing purposes, to take the following preliminary steps to help then monitor the affects on their being: Carter: FAQ

1. List all of your existing health problems and get a medical checkup which will document the existence of these problems.

2. Photograph every part of the body that might change with ORMUS ingestion. The following areas are particularly suggested:

a. The face including details of wrinkles and sagging skin.
b. Hair color. Get good close ups of any hair which has become gray.
c. Hair growth patterns and thickness (this would include baldness and hair loss)
d. Both sides of both hands.
e. Any scars, skin cancers or skin conditions like psoriasis or shingles.
f. Swollen joints like finger joints, knees, wrists and elbows.
g. Any broken or cracked teeth and visible cavities.
h. A picture which shows the whole body profile.
i. A picture which shows the whole body from the front.
j. A picture which shows the whole body from behind.
k. A good picture of the spine which might show any spinal misalignment.

The last three steps or pictures would reveal hip rotations, differences in leg or arm lengths or other posture problems and should be taken with little or no clothing on. If you are modest about this sort of thing you can take the pictures with a film camera, leave the film undeveloped and store it in a safe place. Women may wish to take photos which show breast size and sag as both conditions have been known to change with the use of ORMUS substances.

These pictures can be taken with a digital camera, a disposable film camera, a video camera or a regular film camera. Every person will not need to take every picture. Just take pictures of those areas where change might happen.

3. Make tracings of the feet and hands. Some people have reported that their fingers and toes have gotten longer.

4. Measure your height. This should be done immediately after rising from bed in the morning as this is the time of maximum height during the day. Some people may get as much as 1.5 inches shorter over the course of the day. Several people have reported ORMUS related changes in their height. One woman has gotten 3.5 inches taller at the age of 53.

5. Check the pH of your saliva and urine first thing in the morning and last thing at night for a week before starting with a new ORMUS product.

6. Document changes in frequency, color, odor and ease of urination.

7. Document any changes in stool softness, regularity, color and whether it floats or not.

8. Document any changes in the sound you hear when things are quiet. Many people have reported that they hear a sound in their head after using ORMUS for a while. This sound is called the "hu" or "nada". Notice any changes in the frequency of this sound, it's intensity or the nature of the sound. I always hear a high frequency sound at around 11,000 Hz and occasionally hear a chirping sound in my right ear. You can download a trial version of the NCH Tone Generator which can be used to compare frequency at: http://www.nch.com.au/tonegen/

9. Document any noticeable changes in tooth pain, new teeth, tooth alignment, filling in of cavities or other changes in the teeth.

10. Women should document any changes in their period including changes in the level of menstrual cramping, PMS, periodicity changes, flow levels and resumption of menstruation after menopause.

11. Everyone should document changes in sexual response or orgasm intensity.

12. Some people have noticed that it is easier to quit addictive behaviors like smoking or other drug use. If you have any such addictions it would be helpful to document how those addictions change with the use of ORMUS.

13. Hair analysis can reveal mineral deficiencies over time. Before and after hair analysis would be helpful.

14. Blood tests can reveal immune system changes and/or cancer indicators. If you think that these things might be changing with your ORMUS ingestion it will be helpful to get copies of these tests from your doctor.

========== **Additional information about ormus** ==========

- Ormus m-state elements work better if the body is alkali.
- M-state elements seem to work better when together in a mix; helping each other as co-factors do.
- The material used to create m-state elements appears to define the properties that the m-state elements will have and behave.

The dosage of ormus-m-elements in water that would have a safe effect on the human body has not been determined, although most m-elements appear to be safe.

Avoid exposing ORMUS to sunlight or electromagnetic fields [EMF]. This would include things like cordless phones, cell phones, blue tooth devices, microwave ovens, electric burners, wireless networks and high voltage electric lines.

Dangers of monatomic gold:

Chang reports as follows: "My understanding of monoatomic gold is that it does allow your body to operate at a level beyond ordinary conditions and gives you a great boost of energy. However, in the long run it can cause dangerous side effects for the reason that the current state of the human body can't handle high concentration of energy running through its biocircuitry. The side effects of white powder gold is similar to the side effects of drugs. The more you ingest it, the more your body depends on it and eventually it will degrade your health beyond repair. If you are planning to take white powder gold supplements to improve your health, pay attention to how your body reacts to it. If your body responds with side effects after taking white powder gold, you should stop ingesting it. Side effects are your body's way of warning you to stop eating something that isn't healthy for you. Keep in mind that not all monoatomic gold supplements are created equally."

Chang does not give any scientific or research reference to support his danger opinion. people who first took concentrated m-state materials into their body over a decade ago. There is no evidence that these materials are habituating, that is, they require higher and higher doses, or that they are addictive. On the contrary, people who have taken the m-state materials for a long time tend to reduce their intake as their physical ailments subside. Carter: subtleenergies

List of a Few Places selling ormus supplements or products on the internet: [incomplete list, you can find more ormus sellers on the internet]

The author does not advocate nor promote any of the sources selling ormus products. Today, there are many companies manufacturing products containing M-state substances . Some are working from a pure gold base, while others are using platinum group trace elements from sea sediments, ancient salt beds and volcanic or meteoric earth sources. Marketers may not disclose the raw material nor the ingredients of their products on the label.

Please be aware that using ormus gold supplements on humans has not been evaluated in independent scientific studies. If you do use them, then you may be in uncharted waters experimenting on yourself. You should first read some of the testimonials: ormus gold testimonials

Mining company interest in ormes:

The mineral process industry has to accept that there are virtually an infinite number of cluster and charged colloid combinations in ormus m-elements like m-platinum and m-gold. Indeed, the current diatomic metallic elements represent just the traditional elements in the Periodic Table of Elements. Astute scientists now realize that there should be a second table of monatomic elements. It should be obvious by now that our earth has an infinity of elements on earth, many of which as yet are undiscovered. This lack of understanding is a stumbling block to the mineral industry being able to make m-elements.

Hong Kong 1997 Forum previewed the future applications of ormus. "THE OSMIUM BATTERY of the future will be capable of holding a single charge up to 3,000 miles. The inlay Osmium coating of a computer chip eliminates heat (0) resistance. This elimination of heat will increase the speed of tomorrow's computers up to a 1,000X's over today's computers. Osmium will be used in the future to turn ultraviolet light into electricity."

Although future application of ormus by industry is a bright light, the mining industry is stuck in the previous century and experiencing growing pains. They are still figuring out how to 'mine' ormus e-elements from soil and other raw materials. There is considerable interest by mining companies in the technology required to convert ORMEs to their metallic form. The yield increases by a factor of more than 4000. According to Hudson [and confirmed by an independent source], no

mining company has figured out how to do this. Hudson says the processing technique is highly proprietary and will not be disclosed. An independent source in the mining industry says it's an impossibility and that many investors have lost millions trying. Back to top

Medical interest in m-elements:

Researcher Sorochan searched the internet to find drug companies, universities and medical doctors conducting research about/with ormus m-elements from the years 1980 to 2014. Yes, when just searching with wording "ormus and white powder gold", there were many articles but not by universities or medical doctors. He found no such confirmation when using the wording ormus, white powder gold or m-state elements. But not finding such information, which may be occurring in secret or different worded format, does not mean that such research is not being conducted.

Sorochan then reviewed numerous articles that dealt with cancer and ormus at the National Institutes of Health web-site and did not find any research articles that dealt directly with terms like ormus m-state elements. However he found scores of research articles dealing with transitional metals rhodium, platinum, gold and iridium in **nanoparticle** size. These articles do not disclose their source of nanoparticle nor relate these metals as sources for nanoparticles.

Nanomedicine: is defined as the monitoring, repair, construction, and control of human biological systems at the molecular level using engineered nanodevices and nanostructures [nano size is smaller than viruses]. The new term for ormus m-elements in research is nanoparticles, nanostructures or nanmaterials. Cancer researchers seldom disclose how they got the nanoparticle material and never mention any relationship to ormus m-elements. Many researchers report using nanoparticles as carriers of anti-cancer therapeutics. It is unclear whether m-elements like white powder gold are the nanomaterial used in current cancer research.

You can explore some of the nanomedical research that has been done with nanoparticles gold, iridium, plutonium and rhodium in the past 30 years by clicking on the references that follow: Arvizo: Gold Nanoparticle changes 2010 Adam: mono gold improves brain 2003 Cai: gold targeting cancer 2008 Cobley: gold nanocages kill cancer 2010 Jain: gold in cancer therapy 2012 Hafner: International overview of nanoparticles 2014 Jelveh: Gold NP cancer therapy 2011 Jittapiromsak: Acemannan restores teeth 2010 Jungwirth: Review anticancer activity 2011 Katsaros: Rhodium cancer potential 2002 Lakshmanan: Nanoparticles in cancer therapy 2011 Marques: Platinum and Palladium anticancer 2013 Murthy: Nanoparticles in modern medicine 2007 Novakova: Platinum affect on DNA 2003 Sanjeev: human trials using gold nanoshells treat cancer 2013 Spivak: gold nanoparticles heart failure 2013 Stevenson: Gold nanoparticles attached to DNA 2002 Venugopal: Nanomedine 2008

Significant progress has been made in the field of nanomedicine, resulting in a number of products, including therapeutics and imaging agents, enabling more effective and less toxic therapeutic and diagnostic interventions. The major applications of nanoparticle technology are in hard tissue implants, bone substitute materials, dental restoratives, soft tissue implants, and antibiotic materials. Hafner: International overview of nanoparticles 2014

Another interesting finding was that nanomedicine receives an estimated 40% of its funding from private investment. The development process in nanomedicine is clearly driven by startups and small and medium enterprises, whereas big corporations are not rushing to develop nanoparticle therapy. Hafner: International overview of nanoparticles 2014

The question is: Are nanoparticles the same as ormus m-state elements? This is now an ongoing research in progress for this website article. Researcher Sorochan is currently attempting to find out and will update this issue.

Meanwhile, here are some claims made on behalf of ormus m-elements and medical therapy.

There is a lack of official acknowledgment from government agencies as to whether ormus m-elements research is being conducted by government agencies, medical doctors and drug corporations in the United States. Instead private citizen David Hudson acknowledged that he provided ORME materials to various medical doctors who have given them to patients with cancer. Hudson reported that, in the great majority of these cases, the cancer patients have recovered with indications that the cancer tissue reverted to normal tissue. Carter: Ormus medical research 2009 Hudson did not disclose the names of these doctors.

Hudson also provided, in 1998, Rhodium to the National Institute of Health for in-vitro cancer studies. Carter: Ormus medical research 2009 There is no acknowledgement of this on the NIH website. The research was conducted on a very limited basis with conflicting results. A study at University of Illinois, tested Rhodium ORME on eight different cell lines [no acknowledgement of this on the NIH website]. This showed that Rhodium ORME was not toxic. Carter reported that, since

Rhodium ORME did not act on cancer cells by killing them, many other mechanisms considered not normal in cancer research are now being investigated. Carter: Ormus medical research 2009

A Russian report that Dr. Vladimir Poponin and his scientists had discovered a phantom DNA effect from orme m-elements. Cancer cells exposed ORME m-elements reverted to normal cells in the body but do not do so in the petri dish. This different behavior was explained that there must be some factor [such as m-element] present in the body that is not present in a petri dish which promotes this reversion. One explanation could be that there is a non-material field congruent with the body which contains the information the DNA needs to repair itself. Poponin realized they had demonstrated a link (or coupling) between the electromagnetic energy of the DNA molecule and the zero energy vacuum substructure predicted by quantum physics. Carter: Ormus medical research 2009 In essence, DNA can connect to free energy in space; an implication that mental telepathy between persons is possible.

Poponin's discovery was also supported by physicist Matti Pitkanen in 1997, who postulated that quantum coherence operates between our Universe and somewhere else and that this connection may be directly responsible for psychokinesis [which is the direct control of matter by mind]. Carter: Ormus medical research 2009

Scientists have proven that DNA can be reprogrammed by Words and Frequencies, giving credibility to meditation, acupuncture. Fosar; Reprogramming DNA proven 2001

The magic white powder Gold is perceived as a substitute for a natural substance occurring in the human body. This substance is seratonin and the body manufacturer is the pea-shaped pineal gland.

Medical research application of ormus m-elements in health appears to be going on in a stealth fashion by those more interested in making money than healing sick people. For example, researchers at the University of Texas, H.R. McDaniel M.D., and B.H. McAnalley, used rhodium, derived from aloe vera plant to make acemannan. Claims were made for acemannan that it cures cancer. Carrington Labs took over the product for marketing but had difficulty marketing the product and turned it over to Mannatech. Mannatech, a multi-level marketing firm, made unsubstantiated claims about their acemannan products that were formulated for human consumption. Mannatech, in turn, was ordered by the FDA to stop making false claims while marketing acemannan. Mannatech has a credibility history of FDA warnings about making false product claims. Consumer Digest Report 2007 Carter: health benefits of ormus

The United States Department of Agriculture (USDA) in 2000 approved Carravet® Acemannan Immunostimulant [a spine-off of the original acemannan] for use in the treatment of fibrosarcomas in dogs and cats. It has not been cleared for cancer treatment in humans.

Meanwhile, the internet is full of marketers selling various mixes of ormus m-elements that claim to heal and improve wellbeing. Back to top

Youngevity

Hudson, Carter and other ormus advocates are not the only ones promoting ormus m-element sources found in soils and plants. There are other competitive entities marketing similar supplements to ormus. A major one, fostered by Dr. Joel Wallach, is Youngevity, that is claimed to obtain colloidal minerals from humic shale.

According to Wallach, **humic shale** [often referred to as "a special ancient rainforest deposit"] is mined, crushed, ground to a powder-like consistency, and placed into large stainless steel vats. The vats are then submerged in "cool, contaminant free water at low temperatures". After 3-4 weeks, during which time water-soluble components of the shale enter into solution, the bitter-tasting leachate [liquid that, in the course of passing through matter, extracts soluble or suspended solids, or any other component of the material through which it has passed.] is siphoned off, filtered and ready for tonic, capsule, and oral-spray production. Advertisements state that colloidal supplements contain 75 "minerals" but overlook stating the amounts on supplement labels. [Marketing companies interchangeably use the terms minerals and elements. Pontolillo: Safety colloidal supplements 1998

As of 2010, of the five such mines operating in Emery County, Utah, three supply main manufacturers with bulk quantities of shale leachate that are repackaged and sold as distinct products by a burgeoning network of multilevel distributors. The humate mines are generally small operations, and the tonnage produced is relatively small. Thus, the mines are generally active only intermittently, depending on market demand. Most, if not all, of the humate being mined in Utah is used as a nutritional supplement. Carroll: Wallach validity 2014

No matter what sort of health challenge a person may have, Dr. Wallach's recommendation is always the same: "Start by saturating with all 90 essential nutrients. Take one fluid ounce of ME [Majestic Earth mineral]. Minerals, one fluid ounce of ME. Ultimate Classic twice daily for 90 days." Many of his claims are not backed up with scientific control studies, but instead are anecdotal or fictional. Carroll: Wallach validity 2014

Difference between ormus and youngevity: Ormus and youngevity speak different languages. That is, each uses a different term to describe itself; e.g. ormus uses m-elements while youngevity uses colloidal minerals. Are these two terms referring to the same substance? Modern day alchemists refine ormus monoatomic elements from volcanic soil, ocean water and/or salt beds as a single m-element ingredient and can package it in their supplements as a single element or as a mix; whereas youngevity gets its raw material from special soil called humic shale, and then packages all the leachate ingredients in the supplements. Youngevity adds other substances like herbs, blueberries, strawberries and orange juice to sweeten the taste; or vitamins, amino acids, and other beneficial nutrients. The question is: are ormus and youngevity supplements similar? The answer is a future research project.

Researcher Sorochan e-mailed Youngevity with pertinent questions about its products, but responses neglected to provide answers.

Both marketers of ormus and youngevity products lack transparency research disclosure and documentation to back up their claims. Back to top

Controversies:

What classical science does not teach us is that there is, in fact, another phase of matter called monatomic materials that have ceramic-like properties. Davis: Blue Emerald Having two opposite diatomic vs monatomic views of elements does contribute to confusion and controversy.

Limited spectroscopy: Another issue adding fuel to controversy is the lack of admission from chemical and physics-metal experts in admitting that traditional spectroscopy techniques are unable to identify ormus matter. A major cause of controversy is traditional science being unable to use its conventional analysis of spectroscopy to detect and identify monatomic elements in using conventional procedures used for identifying diatomic elements. None of the detection techniques of analytical chemistry can detect monatomic elements. They can only detect elements by interacting with their valence electrons. Because the valence electrons of monatomic atoms are not detected, the m-element atoms are unidentifiable. To detect a monatomic element requires that you first convert it from its monatomic state to its normal state to allow the element to be detected with conventional instrumentation. As a result, this phase of matter has existed as a stealth material right under the noses of scientists without detection until very recently. Although numerous scientists are recognizing the mysterious stealth matter, many more defend their old science [mis-understanding] that elements only exist in a diatomic state.

Generating skepticism about ormus matter is the lack of Federal agencies, such as NASA, Food and Drug Administration [FDA] and Institutes of Health, in publically admitting that they are investigating ormus matter.

Bioavailability lacking for ormus: Another big issue is the lack of evidence of bioavailability for ormus m-state elements: There are claims by Hudson that m-state elements are absorbed into the body, but the amount absorbed are weak details, their affects on the body and how they really work have not been validated by independent research.

Copy cat validatrion: Many web-site companies marketing ormus products attempt to validate their products by referring to Hudson and his reference that Carrington Labs a made product acemannan cures cancer; inferring that it is being used in medicine. Hudson originally made the claim about 1990 and the FDA has since brought lawsuits prohibiting Carrington and its marketing partner, Mannatech, from claiming that ormus cures cancer as well as selling acemannan to cure cancer in humans. So the claim that ormus cures cancer as proclaimed by many ormus marketers is incorrect while at the same time federal agencies are reputed to be investigating same. A lot of hypocrisy here! Consumer Digest Report 2007

Linking space travelers to ormus: Ormus and white gold powder have been linked to the space travelers from outer space referred to as Anannuki, who were reported to have visited Sumeria, land now referred to as Iraq, about 6000 years ago. Author Zecharia Sitchin introduced the ancient myths about Nibiru as Planet X and the alien visitors of the Annunaki in 1976. Numerous anthropologists have questioned the authenticity of tchin's Semerian tablet writings and his stories about space travelers. Questioning such connections raises controversy about linkage to white powder gold and ormus.

Hudson claims contradicted: Russian scientists at the Institute of Mineralogy, Geochemistry, and Crystal Chemistry of Rare Earth's in Kiev explicitly state in their literature that atoms in lattice structures are metallic in nature and that these same atoms in the monatomic state are ceramic in nature. However, Dr. Kogan of the institute does not support all of Hudson's findings as being scientifically valid. It would be worthwhile if we could obtain a detailed critique of Hudson's work from that institute. Davis: Blue Emerald

The monatomic form of an element exhibits physical characteristics which are entirely different from its metallic form. These differences are currently being investigated by nuclear physicists so it isn't possible to make an exhaustive list of the differences. Davis: Blue Emerald

Mysterious activity: Baffling the new alchemy of ormus is that when ormus is transmutated from raw ingredients like ocean water and organic salt, and when inadvertently exposed to Electro-Magnetic-Forces [EMF] or sunlight, ormus loses its electrical magic properties. Rhodium disappears in a flash of light when left out in the sun. This can become a mystery to skeptical novice researchers of ormus and contribute to controversy.

Ormus not linked to Tesla free energy: Ormus is claimed to be found in air, soil, water and living things. Nicolas Tesla, the father of electricity, claimed that he could capture the free energy from the air and convert it into electricity. He even demonstrated this feat by replacing a gasoline engine in a car with an electric motor that got its electricity from the air. He demonstrated his new free energy system by driving the electric car around Buffalo, New York, area for over two weeks. It is interesting that experts of Ormus fail to mention this link of ormus to free energy of Tesla.

Ormus claimes not evaluated: The claims made about benefits from ormus supplements have not been evaluated by the FDA [US Food & Drug Administration]. Although anecdotal evidence, since 1980, has been published for healing benefits, such publications do not replace the need for independent research validation.

Mining claims contradicted by modern alchemists: Because the percentage of ORMEs in certain, particularly rich volcanic soils is so high (up to 6 percent) in comparison with normal high-grade ore [up to 0.0015 percent], there is considerable interest by mining companies in the technology required to convert m-state ORMEs to their metallic form. The yield increases by a factor of more than 4000. According to Hudson, no mining company has figured out how to do this. Hudson states that his processing technique is highly proprietary and will not be disclosed. An independent source in the mining industry says it's an impossibility and that many investors have lost millions trying. This viewpoint has been contradicted by modern alchemists who have been able to convert white powder gold into metallic gold.

Gospel truth not truth: The basis for many of Barry Carter's powerful ormus products are drawn from "non-traditional" information such as David Hudson's antiquainted experiences. Many have taken Hudson's ormus information as the 'gospel truth.' David Hudson and many of the early inorganic chemistry ormus workers, have always stated freely that that they ***believed*** that ormus forms of elements are extremely prevalent in nature, both in inorganic forms in rock, sand, soil and seawater, and in organic forms in soil, seawater and in many plant foods including carrots and grape juice. Although not questioning whether plant foods have ormus properties, it is important to note that good research has yet to prove this. Pinto: Ormus critique 2014

Ormus terminology can be misleading: Pinto has pointed out that there is a wide discrepancy in what is meant by ormus terminology. This may have contributed to much of the confusion and controversy about ormus that exists today. For example, the methods [e.g. wet or dry method] of making ormus products may not be making the same m-state elements. And yet, vendors selling their products name them as m-element ormus products and refer to them as having the same properties. An ormus product made in two different ways may result in two different 'Ormus-like effects' on the same or two different persons. Pinto: Ormus critique 2014

The research about ormus seems to be "hush-hush." Is ormus and its research being suppressed? Are mining companies experimenting with modern alchemy in hopes of finding more inexpensive metallic minerals and keeping quiet to preserve their trade secrets? Back to top

Conclusion:

Two competitive supplements that have similar raw material sources ---- ormus and youngevity were reviewed. Researchers since 1990 have validated that ormus m-elements do exist. Ormus m-elements appear to be essential nutrients for life and they may be more important than synthetic metallic ones. Unfortunately, claims made for ormus and youngevity are poorly documented. A claim or opinion is not solid documentation. It is most difficult to find substantiated research documented references to verify that ormus and white powder gold are for real. Many arm-chair entrepreneurs are selling white gold supplements without proof that their potions really contain white powder gold or other ormus m-state elements or that their supplements really work. They also appear to be guessing about the dosage of m-element to be taken!

Researcher Sorochan searched the internet in an effort to validate claims made for ormus products. While he contacted several persons about the validity of claims made for their ormus products, their responses did not provide documentation proof for their claims.

Having explored many sources of information about ormus, what can be concluded about it? We do know the following about ormus:

1. it does exist in a monatomic state and it is different from the metallic state

2. we can identify it as being different from diatomic metals

3. we can find it in mother nature [prospect for it]

4. we can make it [modern alchemy]

5. we can speculate about its healing properties

But what we *do not* have is undisputed research proof that it heals and prevents diseases and extends life in humans. Lots of speculation from observing plants, animals treated with ormus and a few restimonials from individuals espousing benefits but not genuine proof from independent researchers about human benefits.

However, there is enough research support for Ormus, also referred to as white gold powder/liquid and m-state elements, to respect the possibility that **ormus could be real**. Hudson: monatomic ormie Although ormus is claimed to have magical, spiritual, parapsychic, levitational, healing, altering time - space and energy properties, science and medicine have as yet not fully understood nor accepted the possibilities of ormus. Modern scientists have confirmed the existence of ormus with quantum physics but stopped short of accepting that elements in the Periodic Table can exist in both monatomic and diatomic states. Scientists have difficulty applying quantum physics, resonance and photon light waves to understanding ormus. However, lack of understanding and real proof does not diminish the real possibility that ormus and its benefits may exist.

Ormus elements are found in air, water, soils, plants and animals. Ormus commercials tempt you to buy their ormus powder/liquid supplements on line. They borrow 'belief statements' from Hudson and Carter to sanctify their products and websites. But most do not mention that you can safely get similar ormus benefits from eating raw foods. Plant roots have the ability to convert metallic elements in the soil into bioabsorbable monatomic elements which plants can then absorb. You do ingest ormus m-state elements in very small quantities when you drink clean spring water and eat raw vegetables, fruits and seeds [nuts, grains]. Ofcourse, the FDA, NIH, Department of Agriculture and nutritional groups do NOT recognize nor admit ormus M-state elements .... although they are very much aware of ormus. It is their 'power control mojo!'

You should be aware that Hudson and many of his supporters have advocated caution in using or ingesting ormus supplements: [Quote --] "The processes described here have not all been tested extensively. We do not guarantee the procedures in this document, nor the results obtained by using them. To the extent that you use or implement these procedures or the products thereof, you do so at your own risk. In no event will the authors of this document be liable to you, anyone else, or any organization or government, for any damages arising from your use, or your inability to use these procedures or the product thereof. Apply these procedures at your own risk." A major problem is that ormus m-state elements may not have the same outcome affect on all users.

It is also important to be aware that if ormus was to be applied to heal the many diseases and fix health problems by medical doctors, that such a happening would necessitate changing our health care culture from being a sick care system to that of a real health preventative care system. This indeed would be a world political-economic cultural revolution in more ways than just a change in the current health care system. Ormus also has the potential to fertilize worn out crop fields and vastly increase food production for a hungry world. If we did get such changes, most of those living today might probably live to between 300 and 1000 years.

The vast majority of people are unaware of ormus. The door for ormus appears to be partially closed to the general public for now. It is closed only partially just like our ability to find metallic gold and become rich .... we need to prospect and find it and exchange it for money or other benefits. There are prospectors of manatomic white powder gold who claim to have found it but as yet are unable to attract and convince those with financial-political power to market it to the world. Without such acknowledgement, ormus is under wraps and undercover for now!

> Esoteric and spiritual teachers have known for ages that our body is programmable by language, words and thought. This has now been scientifically proven and explained. our DNA can cause disturbing patterns in the vacuum, thus producing magnetized wormholes! Wormholes are the microscopic equivalents of the so-called Einstein-Rosen bridges in the vicinity of black holes (left by burned-out stars).? These are tunnel connections between entirely different areas in the universe through which information can be transmitted outside of space and time. The DNA attracts these bits of information and passes them on to our consciousness. This process of hyper communication is most effective in a state of relaxation. Stress, worries or a hyperactive intellect prevent successful hyper communication or the information will be totally distorted and useless.
>
> We now know that just as on the internet our DNA can feed its proper data into the network, can call up data from the network and can establish contact with other participants in the network. Remote healing, telepathy or “remote sensing” about the state of relatives etc.. can thus be explained. Some animals know also from afar when their owners plan to return home. That can be freshly interpreted and explained via the concepts of group consciousness and hyper communication.

Gold nanostructures provide a versatile platform to integrate many therapeutic options leading to effective combinational therapy in the fight against cancer. Gold nanostructures can be synthesized with different sizes and shapes to tailor the absorption wavelength to NIR region for generation of heat. A multifunctional platform based on gold nanostructures with targeting ligands, therapeutic molecules, and imaging contrast agents, holds an array of promising directions for cancer research. Recently more attention has been given to develop inorganic NP-based systems, such as gold and magnetic NPs, for drug delivery and therapeutics. 164 references cited]

Mannatech - FDA and rhodium cancer cure claims: Consumer Digest Report 2007

> Mannatech sued by Texas Attorney General. Mannatech, Inc., its owner, Samuel L. Caster, and several related entities have been charged with carrying out an illegal marketing scheme that encourages consumers to believe that its products are effective against many serious diseases. Consumer Health Digest #07-25; July 3, 2007.
>
> Mannatech claims attacked. Ronald L. Schnaar, Ph.D. (a prominent pharmacologist) and Hudson H. Freeze, Ph.D. (a prominent glycobiology researcher) have accused Mannatech of making unwarranted claims for its "glyconutrient" (sugar-based) products. [Schnaar RL, Freeze HH. A "glyconutrient sham." Glycobiology 18:652-657, 2008]. Mannatech suggests that these products can help consumers achieve optimal health and that their use is supported by scientific research. However, the researchers have concluded that except for rare patients with certain types of congenital disorders, no well-designed studies have demonstrated that humans can benefit clinically from ingesting the key ingredients in the products. They also note that some studies that Mannatech cites are legitimate but have no relevance to it health claims. In 2007, the Texas Attorney General accused Mannatech of violating the Texas Deceptive Practices Act by encouraging and allowing their distributors to make claims that mislead consumers into believing that the supplements

dramatically cure or treat serious illnesses. [State of Texas vs. Mannatech Incorporated, Manna Relief Industries, The Fisher Institute, Samuel L. Caster, and Reginald McDaniel. Meade and Kayyem estimated from earlier studies that a short single strand of DNA ought to conduct up to 100 electrons a second. Imagine their astonishment when they measured the rate of flow along the ruthenium-doped double helix: the current was up by a factor of more than 10,000 times-over a million electrons a second. It was as if the double helix was behaving like a piece of molecular wire.]
